

PROGRESS NOTE · Day 2

Date: 2024-11-02

Patient: John Smith MRN: 001-234-567

Attending: Dr. A. Johnson

Subjective:

Patient reports improved chest pain. Still mild shortness of breath. Tolerating diet.

Objective:

BP: 142/86 HR: 78 RR: 16 SpO2: 98% on 2L nasal cannula

Afebrile.

Troponin peak: 2.8 ng/mL (elevated) · confirmed NSTEMI.

Assessment and Plan:

1. NSTEMI · confirmed. Patient underwent coronary angiography this morning.

Findings: 85% stenosis of the right coronary artery (RCA).

Procedure: Percutaneous coronary intervention (PCI) with drug-eluting stent to RCA.

Post-procedure: stable, no complications.

2. Type 2 diabetes mellitus · metformin held peri-procedure.

Blood glucose monitoring ongoing. Will restart metformin post-discharge.

3. Hypertension · lisinopril continued.

4. Medications:

Added: Clopidogrel 75mg daily (dual antiplatelet post-PCI)

Added: Bisoprolol 2.5mg daily (heart rate control)

Changed: Atorvastatin increased to 80mg nightly (high-intensity statin post-ACS)

Aspirin 81mg daily · continued

Labs pending: Blood culture (sent due to fever spike · preliminary, awaiting sensitivity)

Echocardiogram: ordered, not yet resulted.
